Ma D., Nothias F., Boyne L.J., Fischer I.;
"Differential regulation of microtubule-associated protein 1B (MAP1B)
in rat CNS and PNS during development.";
J. Neurosci. Res. 49:319-332(1997).
-!- FUNCTION: The function of brain MAPS is essentially unknown.
Phosphorylated MAP1B may play a role in the Cytoskeletal changes
that accompany neurite extension. Possibly MAP1B Binds to at least
two tubulin subunits in the polymer, and this bridging of subunits
might be involved in nucleating microtubule polymerization and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rienitz A., Grenningloh G., Hermans-Borgmeyer I., Kirsch J.,

J. Cell Biol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SIMILARITY: TO MAPIA
SIMILARITY: TO MAPIA
CAUTION: A C-terminal fragment of this protein (residual fragment)
2459) was originally described as neuraxin in Ref. 3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nerve levels are high early in development but decrease during postnatal development and are low in adults. In dorsal root ganglia levels remain high throughout development. INDUCTION: By nerve growth factor.

INDUCTION: By nerve growth factor.

IOMANN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAP1B to microtubules.

PTM: LC1 is coexpressed with MAP1B. It is a polypeptide generated from MAP1B by proteolytic processing. It is free to associate with both MAP1A and MAP1B. It interacts with the amino-terminal region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PTM:

Biol. Chem. 270:14533-14540(1995).

-!- FUNCTION: CELLULAR MYOSIN APPEARS TO PLAY A ROLE IN CYTOKIN CELL SHAPE, AND SPECIALIZED FUNCTIONS SUCH AS SECRETION AND CAPPING (BY SIMILARITY).

-!- SUBUNIT: MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2 H CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC) A REGULATORY LIGHT CHAIN SUBUNITS (MLC-2).

-!- DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHO CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPE CHARACTERISTIC FOR ALPHA-HELICAL COILED COILS.
-!- SIMILARITY: Contains 1 myosin-like globular head domain.
-!- SIMILARITY: Contains 1 IQ domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ohāra M., Ishiguro N., Shinagawa M.;

Isoforms 1 and 2 are present in dorsal root ganglion, sciattic nerve and PC12 cells after longer exposure. Isoforms 2 and 3 are detected in kidney, cartilage, skin, lung and spleen. Isoform 3 is expressed at high level in skeletal muscle. In adult animals isoform 1 is expressed
